

TASK 1 – Python File Handling & Automation

Project Title:

Automatic File Organizer using Python

1. Objective

The objective of this project is to automate file organization using Python file handling and exception handling techniques.

2. Technologies Used

- Python
- os module
- shutil module

3. Features

- Reads files from folder
- Creates folders automatically
- Moves files based on extensions
- Deletes temporary files
- Uses try-except error handling

4. Code Explanation

The program reads all files from the current folder, checks their extensions, creates folders automatically, and moves files into categorized folders. Temporary files are deleted. Error handling is implemented using try-except blocks.

5. Source Code

```
#importing os and shutil modules
import os
import shutil

# Get current folder path
path = os.getcwd()

# Dictionary for file types
folders = {
    ".jpg": "Images",
    ".png": "Images",
    ".txt": "Documents",
    ".pdf": "Documents",
    ".mp3": "Audio"
}
```

```
# Read all files
files = os.listdir(path)

for file in files:

    # Skip python file
    if file == "file_organizer.py":
        continue

    # Split file name and extension
    filename, extension = os.path.splitext(file)

    # Check file extension
    if extension in folders:

        folder_name = folders[extension]

        # Create folder if it doesn't exist
        if not os.path.exists(folder_name):
            os.makedirs(folder_name)

        source = os.path.join(path, file)
        destination = os.path.join(path, folder_name, file)

        try:
            shutil.move(source, destination)
            print(f"Moved {file} to {folder_name}")

        except Exception as e:
            print("Error:", e)

    # Delete temporary files
    elif extension == ".tmp":

        try:
            os.remove(file)
            print(f"Deleted {file}")

        except Exception as e:
            print("Error deleting file:", e)
```

6. Output Screenshots

```
29 # Check file extension
30 if extension in folders:
31
32     folder_name = folders[extension]
33
34     # Create folder if it doesn't exist
35     if not os.path.exists(folder_name):
36         os.makedirs(folder_name)
37
38     source = os.path.join(path, file)
39     destination = os.path.join(path, folder_name, file)
40
41     try:
42         shutil.move(source, destination)
43         print(f"Moved {file} to {folder_name}")
44
45     except Exception as e:
46         print("Error:", e)
47
48 # Delete temporary files
49 elif extension == ".tmp":
50
51     try:
52         os.remove(file)
53         print(f"Deleted {file}")
54
55     except Exception as e:
56         print("Error deleting file:", e)
```

```
29 # Check file extension
30 if extension in folders:
31
32     folder_name = folders[extension]
33
34     # Create folder if it doesn't exist
35     if not os.path.exists(folder_name):
36         os.makedirs(folder_name)
37
38     source = os.path.join(path, file)
39     destination = os.path.join(path, folder_name, file)
40
41     try:
42         shutil.move(source, destination)
43         print(f"Moved {file} to {folder_name}")
44
45     except Exception as e:
46         print("Error:", e)
47
48 # Delete temporary files
```

PS C:\Users\Madhu\Desktop\task 1- Python File Organizer> python file_organizer.py
Moved photo.jpg to Images
Moved report.pdf to Documents
Deleted temp.tmp
Deleted temp1.tmp
Deleted temp2.tmp
PS C:\Users\Madhu\Desktop\task 1- Python File Organizer>

7. Conclusion

This project helped in understanding Python file handling, automation, folder management, and error handling using try-except blocks.
